GENERAL PRODUCT INFORMATION:

Report Summary

All applicable tests according to the referenced standard(s) have been carried out.

Product Description

The component power distribution switch (IC Current Limiter) limits the output current to within the specified output ratings. These devices provide current limiting and short-circuit protection when supplied by a power source (e.g., 250 VA) in accordance with those specified for LPS outputs in Table 2B. These devices are for use in SELV circuits only.

The overall view of the device on the evaluation board is shown. See Enclosure Id. 3-01 (Overall View of Model MAX4773EUT+T mounted on Evaluation Board) for details. The applicable requirements and verdicts of Annex CC for these IC Current limiter were evaluated. See Enclosure Id. 7-01 (Annex CC - IC Current Limiter Test Results) for details.

Model Differences

Both models are similar except MAX4773EUT+T has an auto-retry feature.

Additional Information

Manufacturer's specification sheet is available per request.

MARKING:

The manufacturer's name and catalog number (due to the small size of the device, the markings may appear on the smallest package or reel). Additional suffixes after the model number designate the type of integrated circuit package, integrated circuit lead types or other features that are considered not to affect the functionality of the device.

Technical Considerations

- The product was submitted and evaluated for use at the maximum ambient temperature (T_{ma}) permitted by the manufacturer's specification of: 85°C

Engineering Conditions of Acceptability

When installed in an end-product, consideration must be given to the following:

- The investigated Pollution Degree is: 2

- These devices are integrated circuit (packages) and the spacings within the device meet functional insulation. The ICs are intended for installation in SELV circuits only. --
- These devices are entirely electronic in nature and have no means for manual operation or reset. --
- The terminals of these devices are for factory wiring only and intended to be mounted on a printed wiring board. --
- These devices have only been evaluated for supplementary overcurrent protection of secondary circuits supplied by the load side of a transformer or battery, and have not been evaluated for branch-circuit protection. --
- These devices have been investigated as electronic overcurrent protective devices in accordance with the requirements contained in Subject 2367 – Outline of Investigation for Solid State Overcurrent Protectors. As a result, use is permitted only on the load-side of an isolating transformer, power supply or battery with maximum levels. --
- Use on secondary supply circuits with a higher power capability requires additional evaluation for reliability, such as are contained in the Standard for Safety-Related Controls Employing Solid-State Controls, UL 991. --
- These devices have not been subjected tests for telecom applications and their suitability for connection to telecommunication networks with outside plant connections should be determined in the end product. --
- These devices were evaluated with respect to continuous current operation at the current levels shown in the electrical ratings section of this Test Report. --
- These devices have been subjected to environmental conditionings with respect to the following conditions (in accordance with UL Subject 2367): Shipping and Storage: -30°C to 70°C / Temperature Range: -40°C to 85°C / Thermal Cycling / Endurance / Abnormal --
- These devices have been evaluated for indoor and outdoor use only. --

Abbreviations used in the report:

Any means used shall be acknowledged by the user before activating a mode of operation which allows for an acoustic output exceeding those mentioned above. For music where the average sound pressure (long term LAeq,T) measured over the duration of the song is lower than the average produced by the programme simulation noise, the warning does not need to be given as long as the average sound pressure of the song is below the basic limit of 85 dBA. In this case T becomes the duration of the song.</p> <p>NOTE 4 Classical music typically has an average sound pressure (long term LAeq,T) which is much lower than the average programme simulation noise. Therefore, if the player is capable to analyse the song and compare it with the programme simulation noise, the warning does not need to be given as long as the average sound pressure of the song is below the basic limit of 85 dBA. For example, if the player is set with the programme simulation noise to 85 dBA, but the average music level of the song is only 65 dBA, there is no need to give a warning or ask an acknowledgement as long as the average sound level of the song is not above the basic limit of 85 dBA.</p>

SubClause	Difference + Test	Result - Remark	Verdict
	outlet complying with BS 1363 part 1:1995, including Amendment 1:1997 and Amendment 2:2003 and the plug part of DIRECT PLUG-IN EQUIPMENT shall be assessed to BS 1363: Part 1, 12.1, 12.2, 12.3, 12.9, 12.11, 12.12, 12.13, 12.16 and 12.17, except that the test of 12.17 is performed at not less than 125 °C. Where the metal earth pin is replaced by an Insulated Shutter Opening Device (ISOD), the requirements of clauses 22.2 and 23 also apply.

Annex CC – IC Current Limiter Testing Results	
Condition Description	Result [State Pass or Fail]
50 cycles with the enable pin held active with the output open-circuited; each cycle consisting of shorting the output and then opening the output	Pass
50 cycles with the enable pin held active while applying a short to the output; each cycle consisting of turning the power on and off	Pass
50 cycles with the enable pin held active with the output loaded to maximum power, each cycle consisting of turning the power on and off	Pass
50 cycles with the enable pin held active while power is applied, each cycle consisting of shorting the output, removing power, reapplying power, removing the short, followed by removal of power	Pass
3 cycles of exposing the device (not energized) to 70 °C ± 2 °C for 24 hours; followed by at least 1 hours at room ambient; followed by at least 3 h at -30 °C ± 2 °C; followed by 3 hours at room ambient	Pass
10 cycles of exposing the device (while energized) to 50 °C ± 2 °C for 10 min; followed by 10 minutes at 0 °C ± 2 °C with a 5 minute period of transition from one state to the other	Pass
7 days with the output short-circuited and the device wrapped in a double layer of cheesecloth. A fast blow 5 A fuse kept in series with the output shall not open and a current meter shall not show a current lower of more than 5 A	Pass
