

Initial Design

1.0

Design Requirements

Parameter	Value
Device Variant	MAX17672C (1.8V Linear Regulator)
Configuration	Step-Down Converter and Linear Regulator
Minimum Input Voltage	6.5V
Maximum Input Voltage	60V
Nominal Input Voltage	24V
Input Steady-State Ripple	3%
Input Undervoltage Lockout Level	6.4V
Step-Down Converter Output Voltage	5V
Linear Regulator Output Voltage	1.8V
Step-Down Converter Output Current	0.1A
Linear Regulator Output Current	0.05A
Step-Down Converter Load Start Current	0.1A
Linear Regulator Load Start Current	0.05A
Step-Down Converter Load Pulse Current	0.05A
Linear Regulator Load Pulse Current	0.025A
Step-Down Converter Load Pulse Edge Rate	10A/us
Linear Regulator Load Pulse Edge Rate	10A/us
Performance Priority	Balance Efficiency and Size
BOM Priority	Low Cost
Mode of Operation	PWM
Switching Frequency	426kHz
Ambient Temperature	25°C

Schematic

Note 1: When PFM mode is selected, AC Loop simulation may fail when the Load Current is low enough to engage PFM operation. PFM mode is hysteretic and there is no AC Voltage to measure.

Note 2: When the Step-Down Converter Output Voltage is greater than 5V, EE-sim shorts INL to ground to avoid exceeding the maximum for INL. Similarly, when the Step-Down output voltage is greater than 5.5V, EE-SIM shorts RESET to ground. In your target system, RESET can be pulled up to any available voltage that is 5.5V or less and INL can be connected to any voltage that does not exceed 5V.
